Vapour Pressure of Solution

24 Jan, 2023 (Shift-II)

①

The Total pressure observed by mixing two liquid A and B is 350 mm Hg when their mole fractions are 0.7 and 0.3 respectively.

The total pressure becomes 410 mm Hg if the mole fractions are changed to 0.2 and 0.8 respectively for A and B. The vapour pressure of pure A is mm Hg. (Nearest Integer)

Consider the liquid and solution behave ideally.

$$350 = P_A^{\circ}(0.7) + P_B^{\circ}(0.3)$$

$$410 = P_A^{\circ}(0.2) + P_B^{\circ}(0.8)$$

$$P_A^{\circ} = ? ; P_B^{\circ} = ?$$

 x_A P_A^0 P_B^0 

The vapour pressure of two volatile liquids A and B at 25°C are 50 Torr and 100 Torr, respectively. If the liquid mixture contains 0.3 mole fraction of A, then the mole fraction of liquid B in the vapour phase is $\frac{x}{17}$. The value of x is 14.

$$\frac{Y_A}{1-Y_A} = \frac{P_A^0}{P_B^0} \left(\frac{x_A}{1-x_A} \right)$$

$$\frac{Y_A}{1-Y_A} = \frac{3}{14}$$

$$Y_A = \frac{3}{17} ; Y_B = 1 - \frac{3}{17} = \frac{14}{17}$$

$$\frac{Y_A}{1-Y_A} = \frac{50}{100} \left(\frac{0.3}{0.7} \right)$$

Question A vessel labelled 1 contains 3 mol of A and 1 mol of liquid B forming an ideal solution. The solution is allowed to reach equilibrium with its vapours. The vapours are then quickly taken out and condensed in vessel labelled 2. Here again the solution is allowed to reach an equilibrium with its vapours. The vapours are again quickly taken out and condensed in vessel labelled 3.

$$\frac{Y_{A,n}}{1-Y_{A,n}} = \left(\frac{P_A^0}{P_B^0} \right)^n \left(\frac{x_{A,1}}{1-x_{A,1}} \right)$$

This process is continued several times.

If $P_A^0 = 700 \text{ mm Hg}$
 $P_B^0 = 350 \text{ mm Hg}$
 $x_A = \frac{3}{4}$

- i) composition of vapour in vessel 1.
- ii) composition of vapour in vessel 2.
- iii) composition of vapour in vessel 100.

$$i) \frac{Y_{A,1}}{1-Y_{A,1}} = \left(\frac{700}{350}\right) \left(\frac{1/4}{1-3/4}\right) = 6$$

$$iii) \frac{Y_{A,100}}{1-Y_{A,100}} = \left(\frac{700}{350}\right) (3)$$

$$Y_{A,1} = \frac{6}{7}; \quad Y_{B,1} = \frac{1}{7}$$

$$ii) \frac{Y_{A,2}}{1-Y_{A,2}} = \left(\frac{700}{350}\right)^2 \left(\frac{3/4}{1-3/4}\right) = 12$$

$$Y_{A,2} = \frac{12}{13}$$

$$= 2 \cdot 3 \approx \infty$$

$$1 - Y_{A,100} \approx 0$$

$$Y_{A,100} \approx 1$$

A liquid solution of A and B for which the mole fraction of A is 0.60 is contained in a cylinder closed by a piston on which the pressure can be varied. The solution is slowly vaporized at temperature T by decreasing the applied pressure, starting with a pressure of about 1atm. Calculate

- B The composition of the vapour in this bubble
- C The composition of the last droplet, and
- D The pressure when only this last droplet of liquid remains.
